

# Statistical Analysis

## 1. Task Description

Implement matrix exponentiation for a square matrix using numpy.

Matrix exponentiation refers to raising a square matrix  $A$  to a non-negative integer power  $n$ , which is computed as  $A^n = A \cdot A \cdot \dots \cdot A$  (multiplied  $n$  times). In Python, you can efficiently implement this using **NumPy**.

## Explanation

### 1. Input Validation:

- Ensure the input matrix is square (rows = columns).
- Verify that the exponent is a non-negative integer.

### 2. Matrix Exponentiation:

- Use `np.linalg.matrix_power` from NumPy, which is optimized for matrix multiplication. It uses fast exponentiation (repeated squaring) for better performance when  $n$  is large.

## 2.Task Output

```
print("Matrix A:")
print(A)
print(f"\nMatrix A^{n}:")
print(result)
```

[2]

```
... Matrix A:
[[2 1]
 [1 3]]

Matrix A^4:
[[ 50  75]
 [ 75 125]]
```

- **CODE:**

```
• import numpy as np
•
• def matrix_exponentiation(matrix, power):
•     """
•     Computes the exponentiation of a square matrix using numpy.
•
•     Parameters:
•         matrix (ndarray): A square numpy array.
•         power (int): The power to which the matrix is to be raised.
•
•     Returns:
•         ndarray: The result of matrix raised to the given power.
•     """
•     if not isinstance(matrix, np.ndarray):
•         raise ValueError("Input must be a NumPy array.")
•     if matrix.shape[0] != matrix.shape[1]:
•         raise ValueError("Matrix must be square.")
•     if not isinstance(power, int):
•         raise ValueError("Power must be an integer.")
•
•     return np.linalg.matrix_power(matrix, power)
•
```

```
• A = np.array([[2, 1],  
•           [1, 3]])  
•  
• n = 4  
• result = matrix_exponentiation(A, n)  
•  
• print("Matrix A:")  
• print(A)  
• print(f"\nMatrix A^{n}:")  
• print(result)  
•
```
